

MLSTravels – Requirements & Confluence Notes

Client Product Project | Business Analysis / Product Management Documentation

1. Project Context

MLSTravels is a client-focused digital product for a taxi/cab driver who manages cars and shares duty opportunities with interested joiners. The objective is to organize the existing business process into a simple web-based workflow.

2. Requirement Gathering

The requirement-gathering phase focuses on understanding the client's current process, business problem, users, information needed, and expected workflow before moving into product development.

3. Stakeholders

- Client / Business Owner – manages cars, duties and updates.
- Joiners – people interested in available driving duties.
- Product / Project role – converts business needs into requirements, workflows and deliverables.

4. Initial Business Problems Identified

- The client needs a dedicated place to manage and communicate duty-related information.
- Duty information needs to be presented clearly to interested joiners.
- The owner needs control over what information is posted and managed.
- The process should be simpler and more organized than handling everything manually.

5. Requirement Notes

Requirement Area	Requirement	Priority
Access	Owner should have controlled access to the management side.	High
Duty Posting	Owner should be able to create and publish duty-related information.	High
Duty Details	Posts can contain relevant details and an image where required.	High
Joiner View	Interested joiners should be able to view available duty information.	High
Interest Flow	Joiners should have a clear way to indicate interest / join.	High
Status / Completion	Owner should be able to mark a duty as completed and manage the related post.	Medium

6. User Stories

- As an owner, I want to post a duty so that interested joiners can see the opportunity.
- As a joiner, I want to view duty details so that I can decide whether I am interested.
- As a joiner, I want to express interest so that the owner knows I want to join.
- As an owner, I want to manage the status of a duty so that completed information does not remain unnecessarily active.

7. Requirement-to-Feature Thinking

The requirements were treated as the input for product decisions. The workflow was considered as: Business Problem → Requirement → User Story → Feature → Acceptance Criteria → Product Build → Testing → Client Feedback.

8. Documentation Approach

- Requirements were organized as structured project notes, with Confluence-style documentation used as the reference point for requirement thinking.
- The documented requirements are intended to become the baseline for the BRD and FRD.

9. Open Questions / Clarifications

- Exact fields and information required for each duty post.
- Preferred communication/contact method for interested joiners.
- Which information should be visible publicly versus only to the owner.
- Rules for editing, completing or removing a duty post.

10. Requirement Outcome

The outcome of this phase is a structured understanding of the client's business process that can be converted into formal BRD/FRD documentation and then implemented as an MVP.
