

MLSTravels – Live Project & Client Experience

End-to-End Product / Project / Business Analysis Case Study

1. Project Overview

MLSTravels is a real client-oriented product project created for a taxi/cab driver who manages cars and needs a structured way to publish duty opportunities and coordinate with interested joiners.

2. My Role

- Business requirement understanding
- Requirement documentation
- Product workflow definition
- BRD / FRD preparation
- MVP feature planning
- Product implementation using a no-code/AI-assisted development approach
- Testing and iteration
- Client-focused delivery

3. End-to-End Project Approach

Client Discussion → Requirement Gathering → Requirement Documentation → BRD → FRD → User Flow → MVP Planning → Product Build → Testing → Client Feedback → Improvements → Live Product.

4. From Requirement to Product

Project Stage	What I Worked On
Discovery	Understood the client's business process and the purpose of the website.
Analysis	Identified users, problems, requirements and expected workflows.
Documentation	Structured requirements into BA documentation, BRD and FRD.
Product Planning	Translated requirements into MVP features and user flows.
Execution	Created and refined the working web product using Lovable and supporting tools.
Validation	Reviewed the product against the intended workflow and client requirements.
Delivery	Made the product available as a live website for the project.

5. Client Experience

- Worked from a real business requirement rather than a purely academic case.
- Considered the client's actual workflow while defining product features.
- Focused on keeping the experience simple and practical for the owner and joiners.
- Used feedback and requirement understanding to shape the product.

6. Product / Project Challenges

- Converting a real-world manual business process into a digital workflow.
- Balancing owner requirements with a simple joiner experience.
- Deciding which functionality belongs in the MVP and which can be future scope.

- Maintaining alignment between requirements, product behavior and the delivered website.

7. Live Product

Live website: <https://mlstravel.lovable.app/>

8. Tools / Methods

- Lovable – AI-assisted/no-code product development
- Confluence-style requirement documentation
- BRD / FRD
- User stories and acceptance criteria
- MVP and feature prioritization
- Workflow analysis and testing

9. What This Project Demonstrates

- Business Analyst: requirement gathering, documentation, process understanding and functional requirements.
- Product Management: problem definition, user understanding, MVP thinking, prioritization and product iteration.
- Project Management: scope, planning, execution, validation, stakeholder/client communication and delivery.

10. Key Learning

The main learning from this project was that product development starts before development. A useful solution begins by understanding the business problem, converting it into clear requirements, defining the user workflow, prioritizing an MVP, validating the product and improving it based on feedback.

11. Portfolio Positioning

This project can be presented as an end-to-end client project rather than only as a website project. It demonstrates the journey from business requirement to documented requirements, product planning, execution and live delivery.
